

AI Summary

■ Executive Overview This document is about Agentic AI, a type of AI that can interact with its environment and make decisions autonomously. The main objective is to understand how Agentic AI works and build applications using this technology. The document covers topics such as: *

- * Retrieval augmented generation Rag Works
- * Building semantic search applications using embeddings
- * Store retrieve embeddings using vector databases
- * Understanding AI agents and their workflows

The key takeaways are: *

- * Agentic AI allows models to answer questions using data from internal knowledge
- * Rag Works solves problems of retrieving relevant information from external documents
- * Semantic understanding is crucial for recommendation systems and document retrieval
- * Hybrid search combines keyword search with semantic search for better accuracy

■ Major Topics *

- * Retrieval augmented generation Rag Works
- * Agentic AI agents and their workflows
- * Building semantic search applications using embeddings
- * Store retrieve embeddings using vector databases
- * Hybrid search combining keyword search with semantic search

■ Key Concepts *

- * Agentic AI allows models to interact with its environment and make decisions autonomously
- * Retrieval augmented generation Rag Works solves problems of retrieving relevant information from external documents
- * Semantic understanding is crucial for recommendation systems and document retrieval
- * Hybrid search combines keyword search with semantic search for better accuracy

■ Important Definitions *

- * Agentic AI: a type of AI that can interact with its environment and make decisions autonomously
- * Rag Works: a technology that solves problems of retrieving relevant information from external documents
- * Embeddings: numerical vectors used to represent text data in a vector space

■ Key Takeaways *

- * Agentic AI allows models to answer questions using data from internal knowledge
- * Retrieval augmented generation Rag Works solves problems of retrieving relevant information from external documents
- * Semantic understanding is crucial for recommendation systems and document retrieval
- * Hybrid search combines keyword search with semantic search for better accuracy
- * Faiss and ChromaDB are popular vector databases used in Agentic AI applications
- * FastAPI is a modern Python web framework used to build backend AI applications.
